

Toy World – E-commerce-Database-Management-System

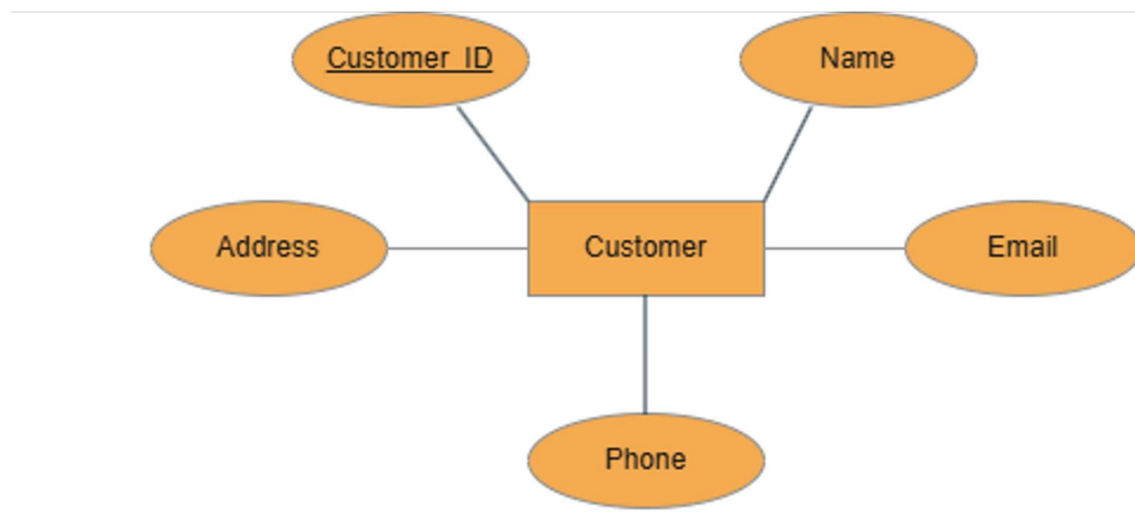

Chapter 3

Introduction

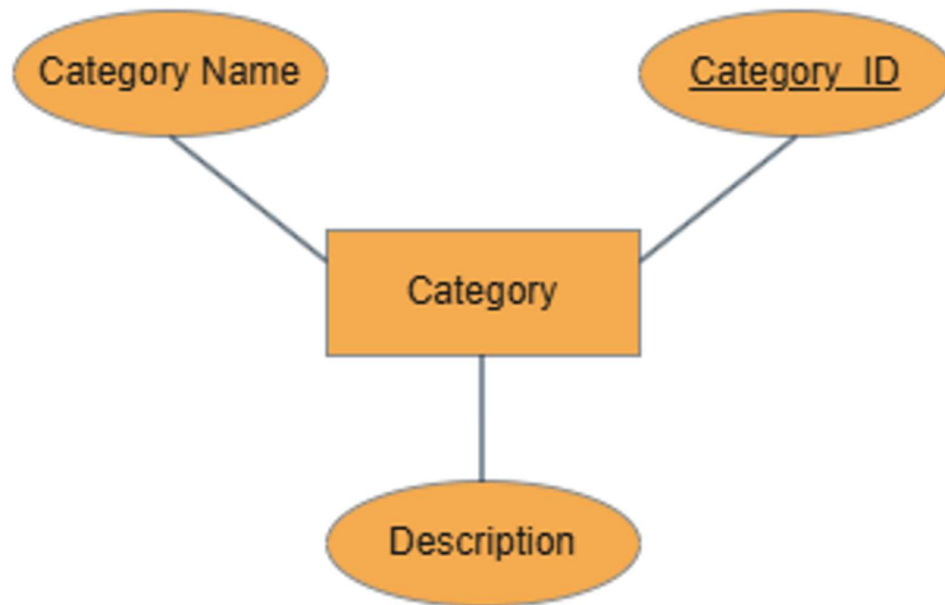

In this stage of the ToyWorld E-Commerce Database project, an Entity-Relationship (ER) Diagram is designed to represent the overall structure of the database. The ER diagram identifies all the important entities involved in the ToyWorld online shopping system, along with their attributes and primary keys. It also illustrates the relationships between entities such as customers, products, orders, payments, and shipments. Appropriate cardinality and participation constraints are used to accurately model the interactions within the system. This ER diagram provides a conceptual design that serves as the foundation for developing the relational database schema and implementing the ToyWorld E-Commerce Database Management System.

Entity Relationship (ER) Diagram and Relationships:

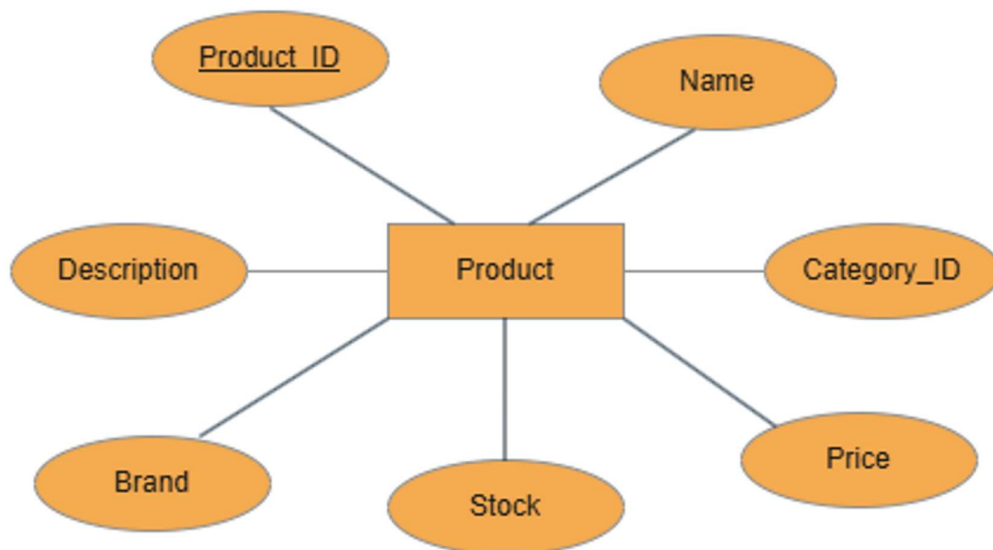

1.Customer

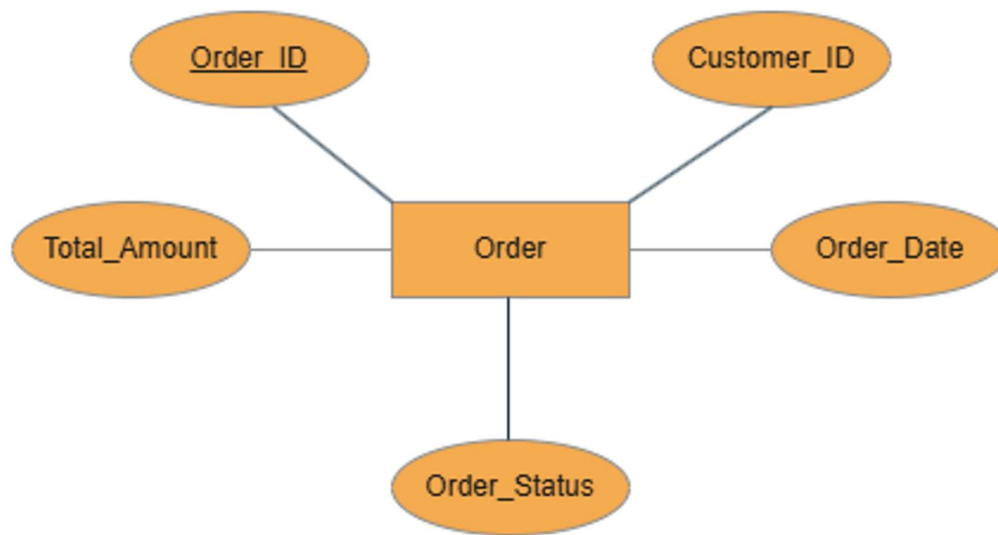

2.Category

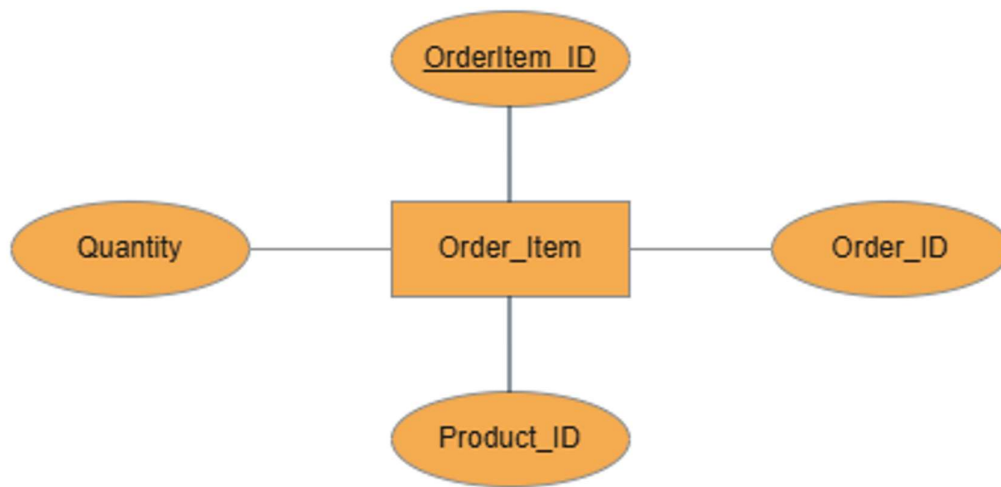

3.Product

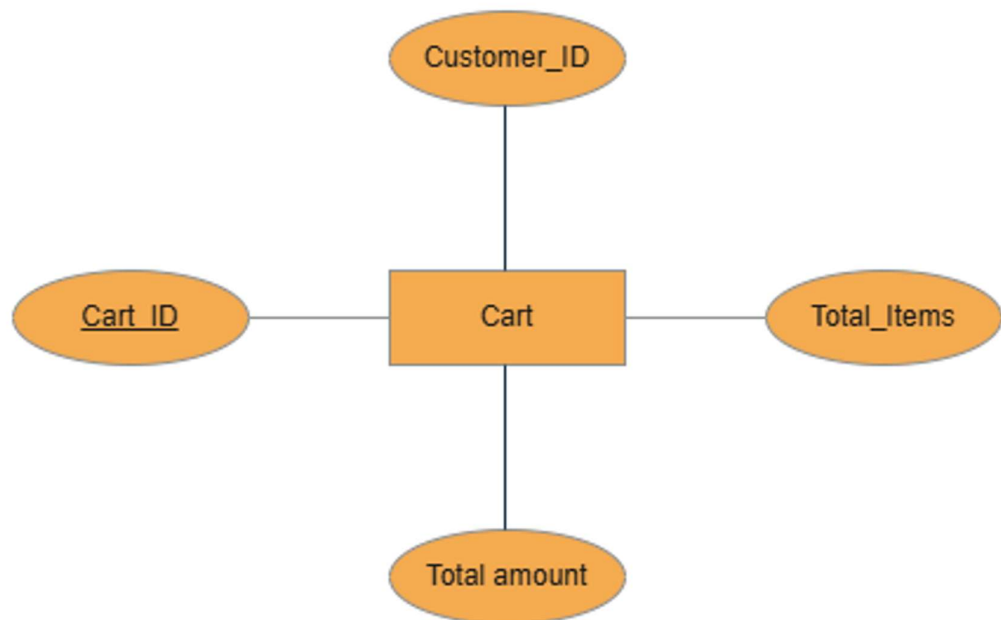

4.Order

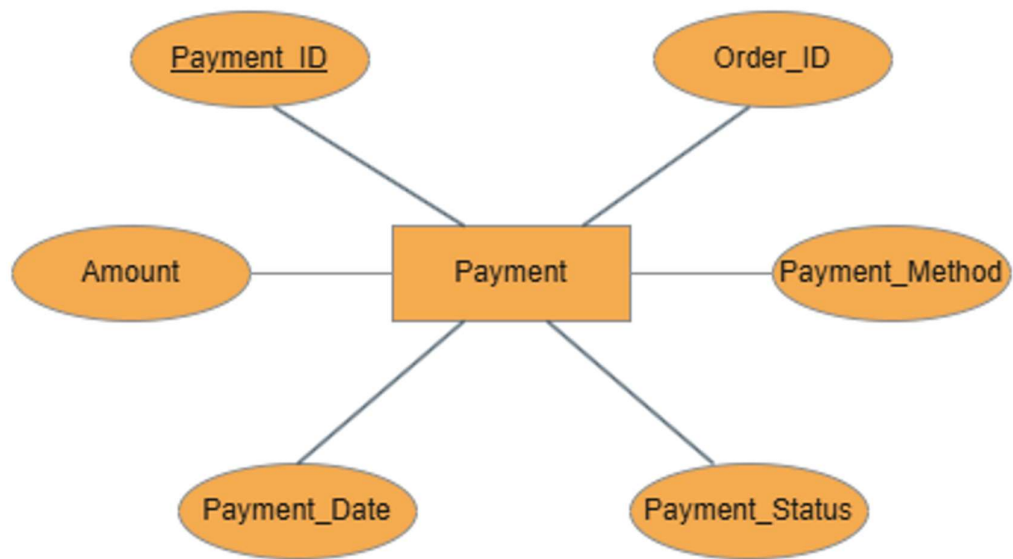

5.Order_Item

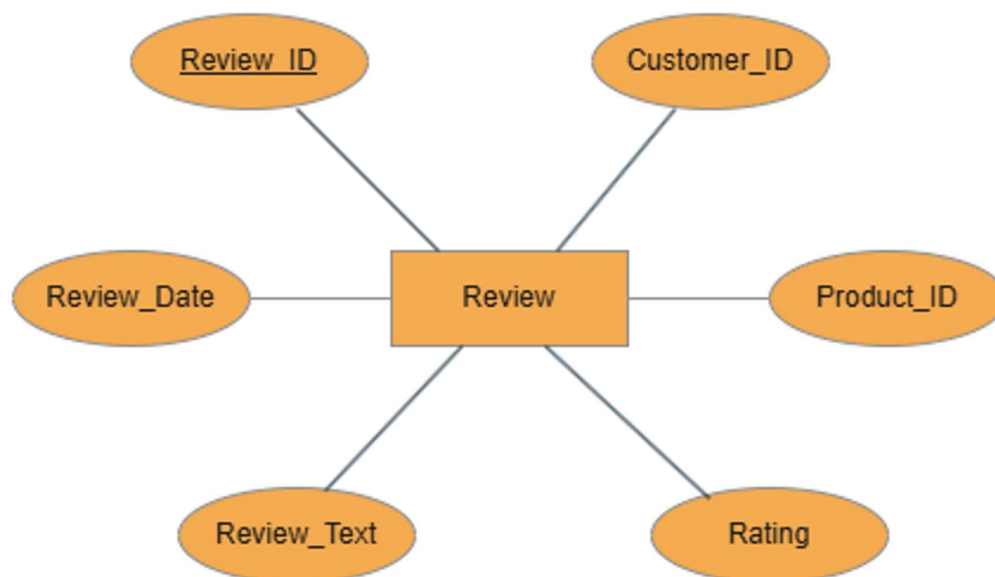

6.Cart

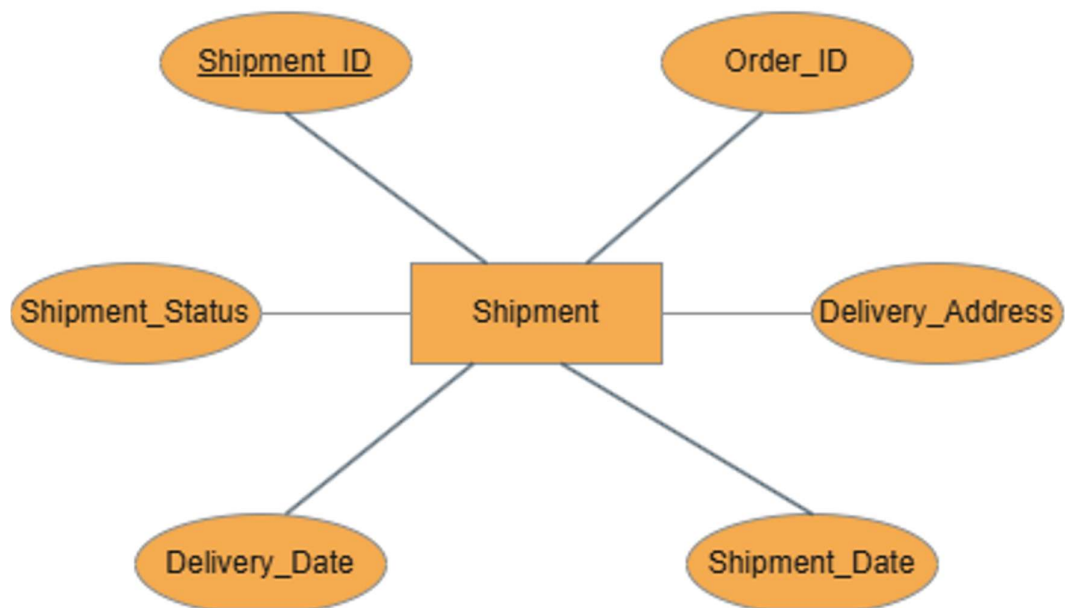

7.Payment

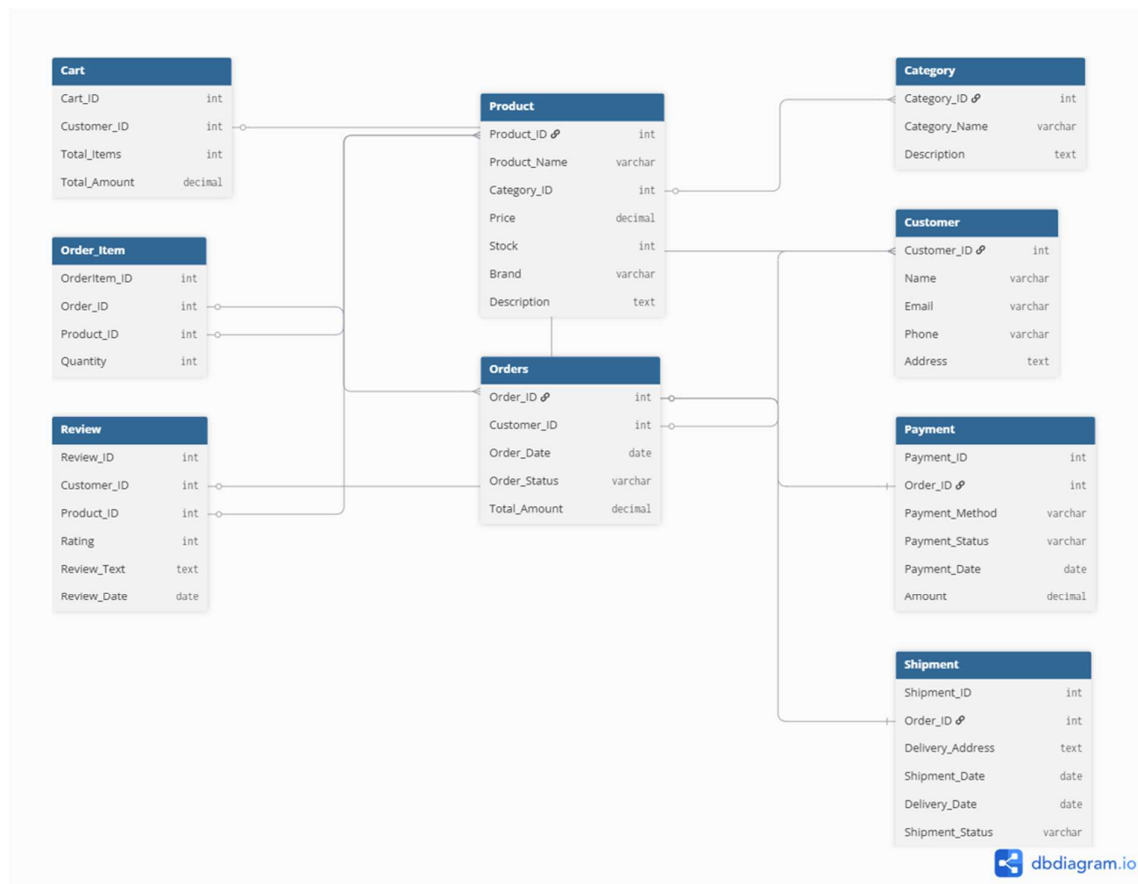

8.Review

9.Shipment
